ABOUT

Curious creative, grounded in what actually works

I'm a Senior Product Designer originally from India, now based in Berlin. My path wasn't traditional: I taught myself UX from the ground up, later formalising it with a CUA certification from Human Factors International.

Over **8+ years** I've worked across mobile, enterprise, automotive and fintech, bringing both visual craft and structured UX thinking to every project. What I care about most is building products that are clear, useful, and genuinely easy to live with.

What I do

Product Design (end to end) Design Systems
Enterprise & Fintech UX Mobile & App Design
UX Research & Strategy Design Advisory

Selected clients & brands

Dell Technologies · Prestige · Jio-BP · Ola Money ·
Royal Enfield · Vijay Sales · AM/NS India · Embassy
REIT · GITAM · KIMS Health

- 01 Research-led.** Grounding decisions in real user behaviour, not assumptions — from discovery through validation.
- 02 Systems thinker.** Scalable component libraries and documentation that keep teams consistent long after handoff.
- 03 Comfortable with complexity.** Dashboards, platforms and workflows for data-heavy enterprise, automotive and fintech products.

JIO-BP Fuel Booking App

ROLE

Lead UX/UI Designer

TIMELINE

4 Weeks

TEAM

Sole Designer · 2 Eng · PM

SCOPE

Research → Prototype → Test

Digitising a fully offline fuel-booking experience so drivers can find stations, check availability, and reserve a slot before they leave home.

Jio-BP — a Reliance & BP joint venture — operates one of India's largest mobility-station networks, yet the booking experience was entirely offline: no way to check wait times, compare prices, or reserve ahead. I was brought in as Lead UX/UI Designer to design the end-to-end experience from research to high-fidelity prototype.

Four themes across every session

A one-week discovery sprint combined user interviews, station-manager sessions and a review of four competitor apps (HP Pay, BPCL Smartdrive, PetroCard). The key gap: **no competitor offered pre-booking with real-time confirmation** — which became Jio-BP's core differentiator.

INSIGHT 01

No visibility into nearby stations

Users couldn't compare stations or wait times before leaving — 6 of 8 had driven to a full station.

INSIGHT 02

Booking lacked clarity & confidence

No clear confirmation or status tracking — 5 of 8 wanted a confirmation SMS.

INSIGHT 03

Manual processes bottlenecked staff

All 3 station managers flagged peak-hour queues caused by manual bookings.

INSIGHT 04

First-time users couldn't self-serve

No onboarding — 4 of 8 dropped off before completing their first booking.

"I just drive around hoping the nearby one isn't packed. There's no way to know until you're already there."

— Fuel customer, Bangalore

Two primary users, one shared frustration: time

PRIMARY · FLEET MANAGER

Rohan, 32

Fleet Manager · Mumbai

GOALS

- Fuel 3-5 vehicles daily without queues
- Track fuel spend across vehicles in one place
- Plan visits around peak traffic

FRUSTRATIONS

- Wastes ~20 mins/day waiting at full stations
- Can't verify fuel quantity remotely
- Manual expense tracking is error-prone

BEHAVIOURS

- Uses Google Maps but it lacks wait times
- Calls ahead — unreliable
- Manages bookings via WhatsApp

INDIVIDUAL DRIVER

Sneha, 27

Marketing Executive · Pune

GOALS

- Find a station near her commute route
- Avoid queues on a tight schedule
- Know fuel cost upfront

FRUSTRATIONS

- Drove 10 mins to a station out of CNG
- Maps shows stations, not availability
- No way to confirm open before arriving

BEHAVIOURS

- Fills up on the way to work
- Relies on WhatsApp groups for tips
- Would pre-book to guarantee a spot

Every screen designed to reduce friction

END-TO-END FLOW — ONBOARDING TO BOOKING CONFIRMATION

Key design decisions

Map-first home. The nearest station and today's fuel price lead the screen — the two things users checked first. Stations appear in spatial context, not a list, cutting decision time.

Confidence in booking. A large "Booking Confirmed" status chip with a countdown sits above the fold — the single most-tested element.

Lightweight registration. Split across four discrete steps so users recover from errors without losing progress — reducing drop-off.

Value-led onboarding. Three cards lead with the payoff — find a station, book fuel, earn rewards — rather than feature lists.

Impact & learnings

The prototype was validated across two rounds of usability testing — a hallway round (n=5) and a moderated remote round (n=8). Metrics below are from testing, not a live launch.

87%

Task completion on the fuel-booking flow (moderated test, n=8)

3.2×

Faster to find a nearby station vs. the manual process

4.4/5

Average satisfaction score across tested users

01

Test earlier, with rougher artefacts. Paper sketches with 2-3 users would have surfaced the map-vs-list insight a week earlier.

02

Design edge cases from day one. Error, empty and low-connectivity states were added late; they often reveal problems the happy path hides.

03

Brief stakeholders on UX debt early. Framing trade-offs as "this now vs. that later" speeds alignment.

Auditing the Asset Lifecycle in a Global DAM Ecosystem

ROLE

UX Researcher · Strategist

TYPE

B2B Enterprise Research

DURATION

8 Weeks

METHODS

Interviews · Audit · Workshop

A DAM platform nobody trusted — four years of organic growth with no governance, taxonomy or defined asset lifecycle. My job: find out why, and deliver a plan to fix it.

A global marketing organisation had run their Digital Asset Management platform for 4+ years without governance. Teams built workarounds — private Dropbox folders, WhatsApp threads, email attachments — because the platform had failed them enough that they stopped using it. No UI deliverable; the output was insight, strategy and prioritisation.

01

Interviews

8 across
managers,
creatives, ops

02

Content Audit

12,000+ assets
reviewed

03

Process Map

Lifecycle across
4 teams

04

Workshop

Cross-functional
co-prioritisation

05

Action Plan

Quick-wins +
roadmap

Six systemic problems — not user errors

84 observations across 8 interviews were sorted by affinity clustering; combined with analytics and a full content audit, six organisational failures emerged.

12k+

Total assets audited

35%

Duplicate / near-duplicate files

1.8/14

Avg. metadata fields filled

68%

Preferred email/Slack over the DAM

PROBLEM 01

No taxonomy or naming

Folders named by campaign, team, date, person — 63% of assets had no meaningful filename.

PROBLEM 02

Metadata left empty

14 fields existed; avg 1.8 filled. Search fell back to upload date — useless.

PROBLEM 03

No asset lifecycle

Nothing reviewed or archived. Seven-year-old files appeared beside current campaigns.

PROBLEM 04

Duplicates at scale

4,200+ duplicates — teams re-uploaded rather than searched.

PROBLEM 05

No platform ownership

The DAM was nobody's job — no one owned governance.

PROBLEM 06

Shadow systems

Emailing a file was faster than finding one, so the DAM got bypassed.

Fixing one without the others wouldn't last

PILLAR 01

Taxonomy & Naming

Structured hierarchy and a [Brand]-[Campaign]-[AssetType]-[Version] standard, enforced at upload.

PILLAR 02

Metadata Schema

Reduce 14 fields to 6 required + 4 optional, controlled vocabularies, auto-populated defaults.

PILLAR 03

Governance & Ownership

Appoint a DAM Owner, define upload/review/archive workflows, quarterly audit cadence.

PILLAR 04

Training & Adoption

Role-specific onboarding, hands-on training, self-service reference — trust before adoption.

"Finally seeing everything laid out like this — we all knew the DAM was broken, but nobody had mapped it before. The naming convention issue alone explained so many of our support tickets."

— Workshop participant, Head of Brand Operations

The internal team ran the quick wins

Scope ended at recommendations and workshop facilitation; I checked in at 12 weeks to measure early impact.

BEFORE — AT AUDIT

- ✗ Metadata filled: **13%**
- ✗ Time to find an approved asset: **11 min**
- ✗ Monthly "where is this file?" tickets: **~42**
- ✗ Correct naming format: **<5%**

AFTER — 12 WEEKS

- ✓ Metadata filled: **71%**
- ✓ Time to find an approved asset: **2-3 min**
- ✓ Monthly "where is this file?" tickets: **~17**
- ✓ Correct naming format: **68%**

01

Technology gets blamed for organisational problems. The platform could do everything the teams needed — they hadn't set it up with ownership, process and accountability.

02

The hard part was buy-in. Showing that a quick fix wouldn't solve a structural issue — technical pain was downstream of an ownership problem upstream.

03

Run the workshop earlier. The priority-matrix exercise surfaced constraints that would have reshaped which interviews and analytics I prioritised.

TTK Prestige — Website Revamp

ROLE

Sr. UI/UX Designer

PLATFORM

Web · Desktop + Mobile

DOMAIN

E-commerce · Consumer

YEAR

2024

Reconnecting a 70-year-old trusted appliance brand with digital-first shoppers — through IA, a modern visual system, and a purchase journey that stops losing customers to marketplaces.

Despite strong offline equity, TTK Prestige's e-commerce site was failing to convert: fragmented navigation, a broken mobile experience, and a dated identity. I redesigned the end-to-end experience — restructuring information architecture, modernising the visual system, and building a more intuitive purchase journey.

05

Test

Usability testing
· Iteration

Trusted brand, distrusted website

8 interviews with online shoppers (24–55), a heuristic evaluation against Nielsen's 10 principles, and Google Analytics funnel analysis. Over **68% of traffic was mobile**, yet the mobile experience was fragmented.

PAIN 01

Couldn't find products fast

Deep, inconsistently-labelled navigation buried product lines — high drop-off at category level.

PAIN 02

No filter, browse or compare

No guided filters, recommendations, or hierarchy to move users from browsing to intent.

PAIN 03

Felt untrustworthy online

Inconsistent type, dated visuals, no social proof — users bought on Amazon instead.

APPROACH

Two archetypes

The Loyal Brand Fan (mobile-first, buy direct) and the Comparison Shopper (specs & side-by-side).

"I know Prestige is a good brand, but the website makes it hard to trust them online. I usually end up buying from Amazon instead."

– Interview participant, Female, 34, Bangalore

Fixing the IA unlocked everything downstream

BEFORE

- ✗ Products buried 3 levels deep
- ✗ Blog & Deals isolated from product context
- ✗ No lifestyle/recipe content near Shop
- ✗ Support & About at same level as Shop

AFTER

- ✓ Top categories surfaced in a mega-menu
- ✓ Contextual "Buying Guides" from product pages
- ✓ Recipe hub integrated into PDPs
- ✓ Support moved to footer — nav focused on buying

Key decisions from wireframe testing

Filter placement. Horizontal filters were missed on mobile → moved to a collapsible sidebar (desktop) and slide-up drawer (mobile).

PDP gallery position. Users wanted to see the product before specs → gallery moved to a fixed left column.

Checkout. A stepped 3-screen flow felt safer for first-time buyers; a single-page "Fast Checkout" was kept for returning users.

Results

Before: under 2 min on mobile

↑ **38%**

Session duration on mobile

Before: ~74% bounce on PDPs

↓ **22%**

Bounce rate on product pages

Before: most via Amazon

↑ **2.4x**

Direct-to-buy conversions

01

Fixing IA unlocked everything. Products buried 3+ levels deep were the biggest drop-off driver; surfacing categories drove the bounce reduction.

02

Mobile-first is non-negotiable. With 68% mobile traffic, designing the PDP hierarchy for mobile first changed layout decisions at every level.

03

Trust signals convert. Certification badges, seller verification and delivery estimates were cited as reasons users bought direct instead of Amazon.

LET'S TALK

Thanks for reading.

I'm open to Senior Product Designer roles — currently in Berlin, open to relocate. If any of this resonates, I'd love to talk.
